

# GRASSTREE SHE BRIEF

**Brief No.:** 0004 – 2024  
**Title:** Feral Pig Baiting Program  
**Relevant to:** All Grasstree and All Aquila  
**Date:** 21/02/2024

## Feral Pig Baiting Program and Product

Please be aware that a Feral Pig Baiting Program will be implemented from Tuesday 12<sup>th</sup> March. The baiting program will be operated through Biodiversity Australia (BDA) and will utilise the 'Hoggone' product (approved for site use within Chemaalert and managed under JSA and SWP)

The baiting program is expected to occur over an approximately 1x week period with clean up activities conducted during and after this time.

## What is required of CMW's

CMW's need not take any action, but simply be aware that these activities are occurring. Should a Feral Pig succumb to the baiting within close proximity to an active work area, please promptly bring this to the attention of the Grasstree Environmental Team (Tom Hayes) such that it can be suitably addressed and removed.

Hoggone is a Sodium Nitrate based product (often used as a food preservative) that is generally not harmful to humans and many other species of animals. It is however lethal to Feral Pigs and specially designed feeding trays will be used to help ensure only Feral Pigs access the hoggone baits and food (corn).

Pre-feeding the Feral Pigs has already commenced in preparation for the baiting program.

Should you encounter a specially designed feeding tray, please do not interfere with it in any way.
